

EndoWorks® 7

Endoscopy Information Management Solution

Automated Pathology

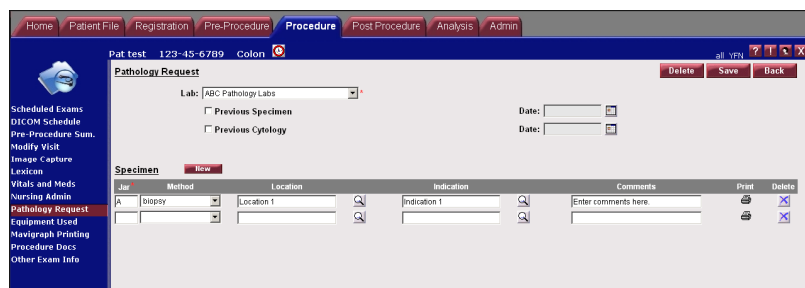

Pathology reports are a vital part of any endoscopy practice. To help improve documentation quality, service speed, and report tracking, EndoWorks 7.4¹ customers can upgrade their system to take advantage of a computerized pathology interface that can be tooled to work with many national and local laboratories. The interface streamlines the entire pathology process for seamless integration with your EndoWorks endoscopy information management system.

What is automated pathology?

The EndoWorks interface allows you to automate each step of the pathology process for your GI lab, from electronic generation of specimen labels and requisition forms to report retrieval and daily logs. The result is improved efficiencies, fewer keystroke errors, easier lab submissions, and faster results for your patients.

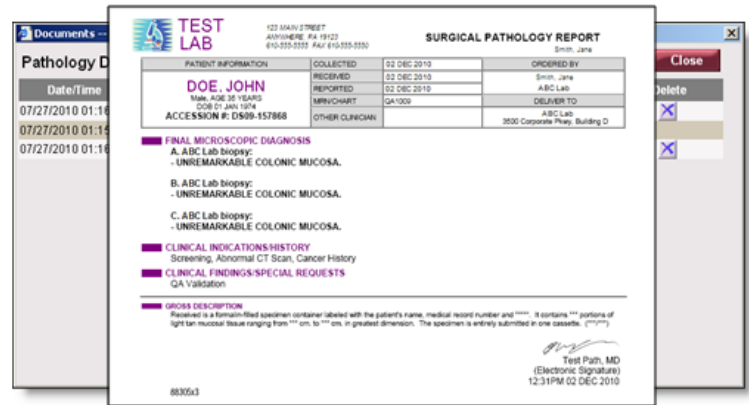

What are the key features and benefits?

- **Electronic Requisitions:** Simplify and expedite the pathology requisition process. Dedicated pathology computers in each of your procedure rooms allow you to quickly generate a pathology request using much of the information already entered into your system, including specific information on each specimen. The electronic requisition is then printed and transported with the specimen to your pathology lab, eliminating manual entry errors and expediting the submission process.
- **Automated Procedure Notes:** Automatically attach essential procedure data and summary notes to the requisition request. This feature provides the pathologist with a more comprehensive picture of the patient's condition to potentially aid in diagnostic interpretation.
- **Specimen Labels:** Easily generate specimen labels using system information. All you need to do is select the sample type, location, and indications, add applicable notes, then print and apply to the specimen containers.

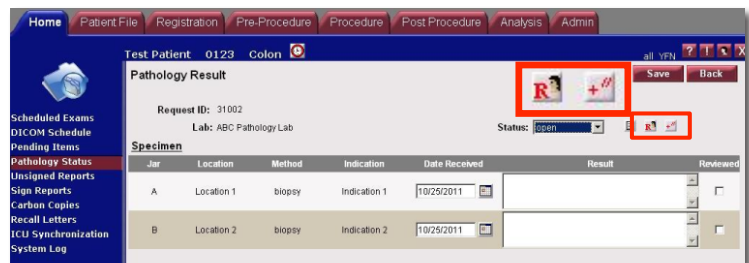

¹ Customers using earlier versions of EndoWorks may be able to use the Olympus pathology interface upgrade. Discuss options and compatibility with your Olympus Endoscopy Account Manager.

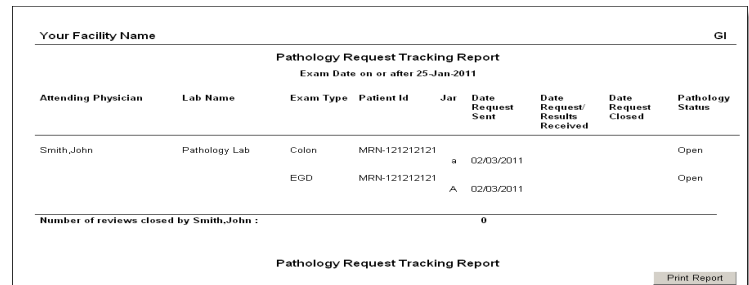

- Pathology Reports:** Automatically receive completed pathology reports back into your EndoWorks system faster than traditional delivery service. You can quickly determine if results are back in by looking at just one EndoWorks screen for all of your open pathology requisitions, then click results to review.

- Patient Recalls:** Easily initiate patient recalls while reviewing pathology reports. Click one button to append the patient's report (if using the report writer feature) and set the patient up for their next procedure under the recall option.

- Pathology Logs:** Efficiently manage and customize your pathology records. The interface enables you to view and print daily specimen logs, electronically access status and diagnostic reports, search for and print out requisitions and lab results, and interface pathology records with your system's digital health records.

Who are preferred pathology providers for the interface?

The EndoWorks pathology interface is designed to integrate with a broad array of electronically enabled pathology labs. To find out if your laboratory is a preferred provider or is eligible to become one, contact your Olympus Endoscopy Account Manager.
